

Innovative Biomaterials...

At ASB, we are focused on developing innovative technical advancements in the field of material science.

While supporting the engineering community and proactively responding to the medical industry's most critical challenges, we have continued to advance our technologies through applicationally focused biomaterials, targeted material synthesis, second source alternatives and the expansion of our secondary operations.

Our product offerings span a wide range of chemical and mechanical properties focused on engineered product design. These include our polycarbonate-based urethanes, ether-based elastomers, hydrophilic materials, silicone polycarbonate TPUs, and antimicrobial products.

In addition to our core materials, we have recently expanded our technical services to include custom solutions and prototype coating capabilities.

Advancing material technology...it's our chemical makeup.
